

J5 is for ICP and debug

LD1, LD2 are low current LEDs  
LD1 is yellow, LD2 is green.

STP36NF06L, or equivalent (logic level power MOSFETs)

Note 1. R11 is a protection resistor against output shorts.  
A value of 0.1 ohms seems to work. It can be replaced with a wire link if protection is not required

## CBUS Solenoid Node with CDU

12V DC power supply version
